

**DIRECTIONS FOR USE FOR DOMESTIC,
INDUSTRIAL AND PUBLIC HEALTH SITUATIONS.**

| Pest | Rate |
|--|---|
| German cockroach | 40mL in 1L water. |
| Australian cockroach, American cockroach, smoky brown cockroach, oriental cockroach, fleas, flies, silverfish, spiders | Initial treatment or extended control or Heavy infestations: 40mL in 1L water. Maintenance treatment or Short term control or Light infestations: 20mL in 1 L water. |
| Ants | Initial treatment 50 or 65mL in 1L water. Maintenance treatment 35mL in 1L water. |

Critical comments

For crawling insects, apply as a coarse low pressure spray to areas where pests frequent. For flying insects, apply as a surface treatment using a fine spray to wet the surface. Apply 5L of diluted spraymix per 100 square metres. If a different water rate is required, adjust the dilution rate to ensure that 2mL of Fendona is applied per square metre for initial treatments, extended control of heavy infestations; and that 1 mL of Fendona is applied per square metre for maintenance treatments, short term control or light infestations. Add a non-ionic surfactant at the registered label rates to improve spreading on hard to wet surfaces. Fendona 15 SC is NOT to be used to control fleas on animals. Use the higher rate for ant control where population numbers are high.

BASF
The Chemical Company

Fendona® is a fast-acting pyrethroid insecticide that controls insect pests on all types of surfaces.

Fendona® keeps on working for months after treatment, with these outstanding features:

- quick knockdown
- odourless
- non-staining
- easy to mix and use
- effective on a wide range of crawling insects
- can be applied indoors and outdoors
- long residual

Fendona consists of microscopic particles of crystalline active ingredient that adhere to many different types of surfaces, including bare and painted wood, glass, brick, concrete and masonry. Cockroaches, spiders and other crawling insects absorb these particles on contact and die quickly.

The active ingredient is so effective that it can flush insects within 5 minutes, knock them down in as little as 30 minutes, and kill within 24 hours. Best of all, **Fendona** keeps on working for months after treatment.

Safety

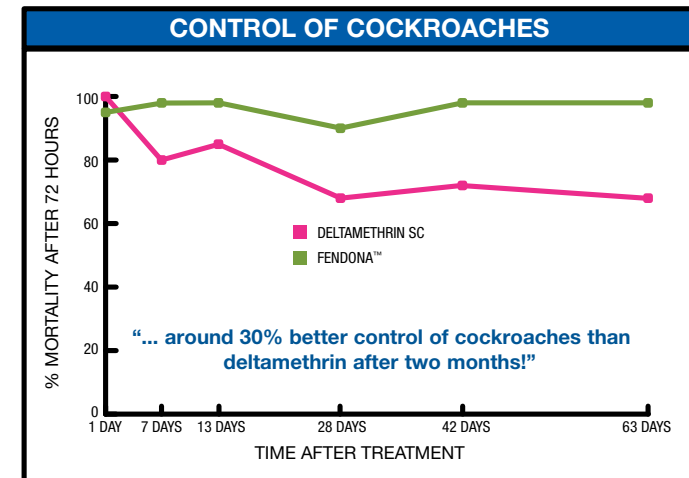

The water-based formulation of **Fendona** is of relatively low toxicity to humans and domestic animals. However it is toxic to fish, and care should be taken to ensure that the product or prepared spray does not contaminate fish tanks, ponds or waterways.

Application

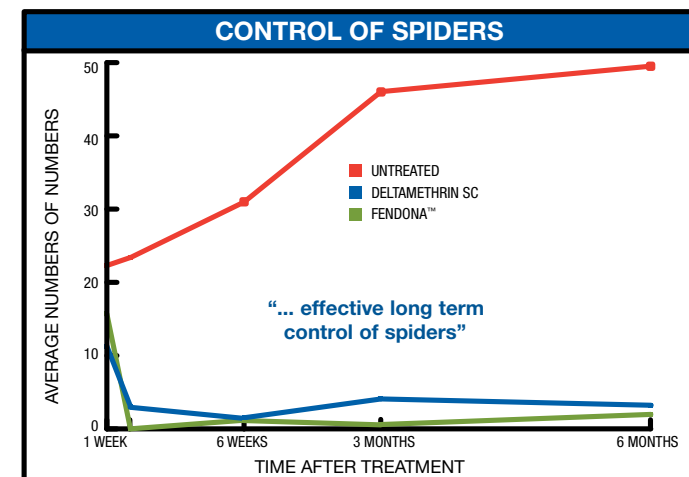

Fendona is suitable for the control of crawling insects, and flying insects which rest on treated surfaces. When used as directed, it may be safely applied indoors, as well as outdoors on walls, eaves, pergolas, fences, etc. Apply **Fendona** with a hand operated pneumatic or hydraulic sprayer at low pressure, not above 30 psi (2 Bar), and with a nozzle that produces evenly sized droplets. Shake the container before measuring the required volume of concentrate and adding to the water in the spray tank.

Relative performance of Fendona

Studies of the activity of Fendona formulations against a range of pests, Price and Pritchard, 1987.

Summary of 10 field trials on web spinning spiders in buildings in Sydney, Miller and Peters, 1989.
